

Add Virtual Drive to Windows VM

Add volume to VirtualBox

1. Open VirtualBox. Right click on the Virtual Machine (VM) and select settings. Go to storage and select “add hard disk”.

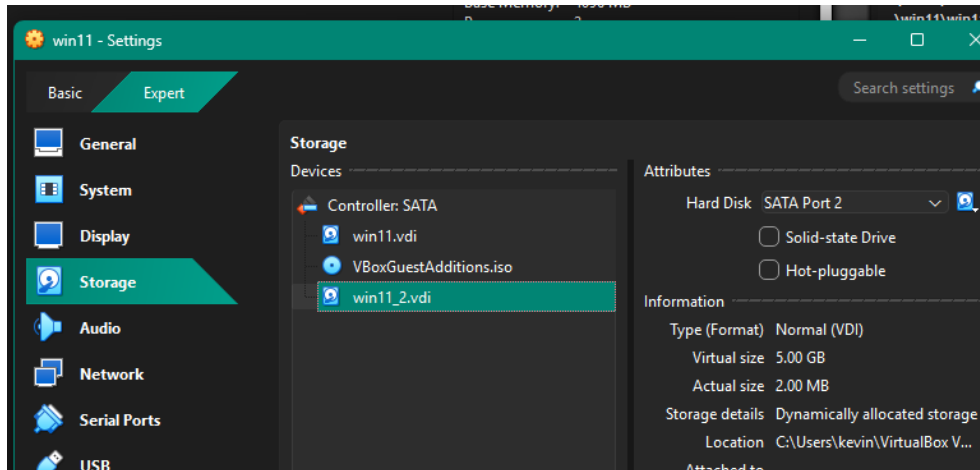

2. Select a size for the hard drive, then select VDI “virtual disk image”. The Virtual Disk Image format allows for resizing as needed. Click Finish.

Add Virtual Drive to Windows VM

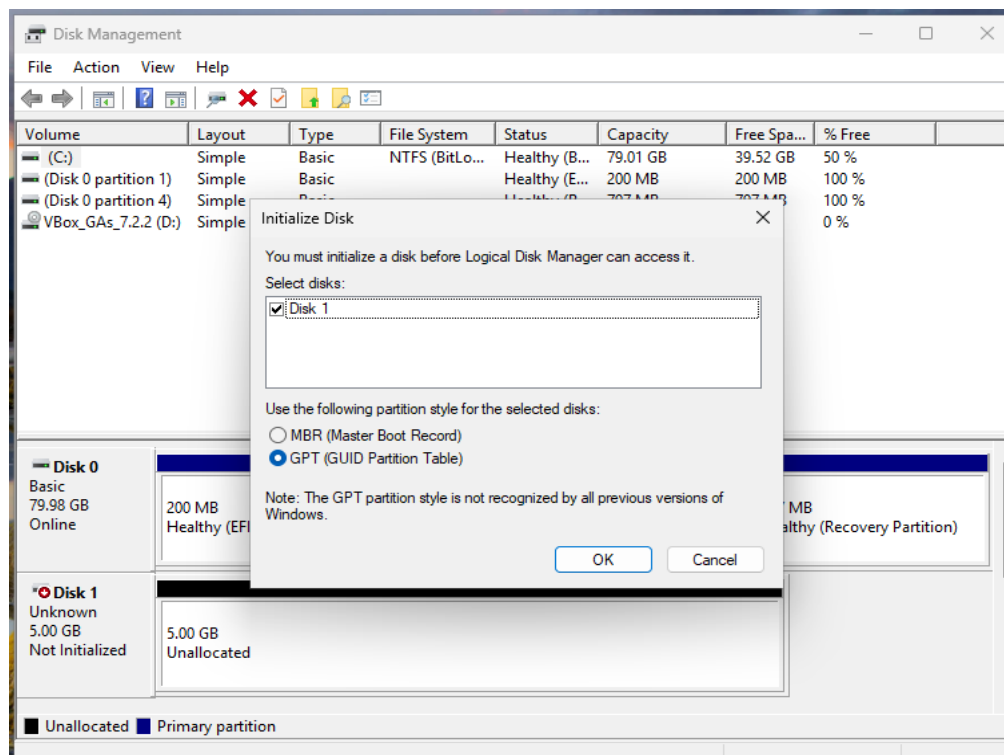

3. Select the VDI file and hit “choose”. The new hard drive VDI is not in the list of storage devices.

4. Hit OK on the settings dialog and start the VM.

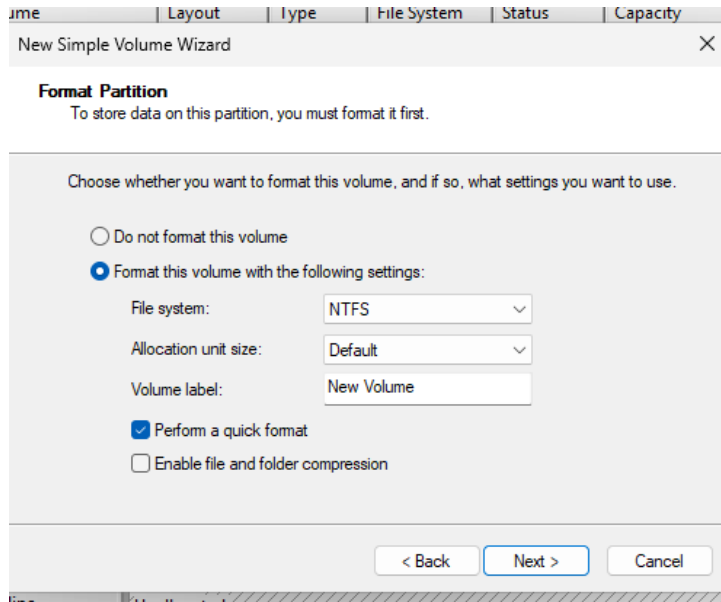

5. Once logged in, right click on the windows icon and select disk management.

6. Under initialize disk, select GPT (GUID partition table).

Add Virtual Drive to Windows VM

7. Right click on the unallocated disk and select “new simple volume”. Choose the maximum size, and assign a drive letter. These are all options in the new simple volume wizard. Choose the default for an NTFS file system and to perform a quick format. Hit next, then finish after reviewing the options.

At this point the new E:\ drive should show up in file manager under this PC.
